

[Toby:] Good networking is like a good utility, like electricity or water where it's just there – available.

[Laura:] The things you think about you do at home when the internet's not working – you know, you turn the router off and on again, you unplug it you plug it back in – it's the same, just on a bigger scale.

[Jason:] So if you like have a problem at home, for example, you could fix it yourself – you wouldn't have to call someone else out.

[Toby:] Networking from the outside is confusing, but when you actually start taking back the veil and having a look underneath, it's really not that complicated: it's normally just some wires going from one place to another and a box connecting them up. Once you get past that and understand how some of the elements work, it really becomes far, far easier to understand what's going on.

[Laura:] So if you have those skills, you know, within your family you're 'that IT person', you're the go-to person for those problems, you're probably, you know, on the right track for doing a career in networking.
