

Understanding Identity

Who are we? What shapes us into the people we are? Over the last 50 years advances in society and technology has meant that we can be whoever we want to be. Infertile couples have the chance of conceiving a child; a man can become a woman; if an organ fails, you can get a new one. But is it all for the greater good? There are people in today's society who wouldn't think twice about putting a patent on our biological and genetic heritage. The tracks on this album discuss issues such as identity, the relationship between the natural and the social sciences, and the colossal topic of ethnicity, especially in the UK. The material was originally produced to support the course DD100, Introduction to the social sciences.
