

Markets in crisis

Markets in crisis

In the first decade of the 21st century we saw financial markets collapse, sudden spikes in food prices and a projected environmental impact of climate change. How was this to effect our environmental operating systems and more importantly our social operating systems? Economist and Nobel prize winner Amartya Sen along with many industry experts discuss re-thinking the social, economic and political systems we have in place today. This material forms part of the Open University course DD309 Doing economics: people, markets and policy.
