

### **Mission to Titan**

Have you ever wanted to explore a distant planet? In this exciting album, Titan, Saturn's biggest moon, is revealed live before our eyes for the first time. In January 2005 the Huygens probe parachuted down from its mothership, Cassini, through Titan's murky atmosphere to rest on its mysterious frozen landscape. Equipped with an impressive array of scientific instruments, producing an incredible series of images, scientists now have a glimpse of what Earth may have been like before life evolved. The Cassini-Huygens achievement was humankind's first landing on a body in the Outer Solar System, and its extraordinary results will be studied in the world's leading scientific journals for years to come.
