

Cyborgs and Cybernetics

What are cyborgs? Would a cyborg future deliver positive human advances or a Hollywood-style nightmare in which human beings have become a sub-species? Could we one day download our minds? This album gives an insight into the development of cybernetics and how it is used to fuse technology and humanity. The interfaces that communicate between man and machine are developing rapidly and to Prof. Kevin Warwick at Reading University, cyborgs are a technological evolutionary step on from humans. With increasingly intelligent robots and nano-technologies - can man keep up with the machines? This material forms part of the Open University course T209 Information and communication technologies: people and interactions.
