

## **TACKLING NOISE POLLUTION:**

### **Tackling noise pollution:**

Noise is one of the forms of pollution that characterises industrial societies. Many forms of noise in the urban environment, including traffic and aircraft noise, can cause significant harm in varying degrees. So just how much noise are you exposed to? The tracks in this album explain the measurement and control of noise and look at how motor engineers and road researchers are trying to cut down on noise pollution from transport. Lastly, two audio tracks featuring Dr Shahram Taherzadeh and Dr Suresh Nesaratnam explore the issues arising from the case studies and provide an overview of course. This material forms part of the Open University course T210 Environmental control and public health.
