

Environment: habitat and conservation

The relationship between sea and land has always been one of dynamic change. Yet, as rising sea levels threaten habitats for wildlife and humans alike, we are today more vulnerable than ever. The 11 video tracks on this album address the complexities of environmental change, focusing on the Blackwater Water Estuary in Essex where a coastal retreat scheme is in operation, managed biodiversity at Wicken Fen in Cambridgeshire, and the search for sustainable forms of development along the River Severn. This material forms part of the course U216 Environment.
